SUMMARY OF NEW USE STORIES

- o Total user stories completed in Sprint 3 and 4
- o **US1:** As an Admin I want to be able to approve shop owners so that I can allow only legal users to be members.
- o **US2:** As a public user/shop owner, I want to see my transaction history so that I can keep track of the books I have purchased or sold
- o **US3:** As a public user I want to add a book to my cart and buy book online so that I don't have to go to the bookstore to buy books.

SUMMARY OF NEW FUNCTIONALITIES

Feature	Priority	Priority Order
Admin to approve shop owners	Critical	5
users/shopowners to access their transaction history	Critical	5
users to add books to the cart and purchase them online	Critical	8

PRODUCT BACKLOG

PRODUCT BACKLOG

Notes:
There are three types of user accounts: Admin, publisher/shop owner and public user.

ID	ITEM	OWNER	PRIORITY	EFFORT	STATUS	DEFINITION OF DONE
1	As a shop owner, I want to remove a book entry, so that I can have number of books under the limit.		High	3.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
2	As a Shop owner, I want to edit book's author information , so that the book's author information is correct.		High	3.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
3	As a Shop owner, I want to change the selling price of a book, so that I can sell the book to the customer at a new price.		High	3.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
4	As a shop owner, I want to change the status of a book to available, so that I can Sell the book to the customer.		High	3.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
5	As a shop owner, I want to change the status of a book, so that I can make the book unavailable to the customer.		High	3.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
6	As an Admin, I want to search for transactions by month so that I can see how many books were sold on the platform each month.		Medium	5.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
7	As an Admin, I want be able to approve or block new users so that I can allow only legal users to be members.		Critical	5.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
8	As an Admin I want be able to edit the details of books so that I can keep all the books up to date		Critical	3.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
9	As an Admin I want to be able to remove books that violate the rules so that the book can no longer be displayed.		High	3.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
10	As an Admin I want to be able to edit the details of a user so that the user's profile doesn't show any incorrect details		High	3.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
11	As an Admin I want To be able to add a new user so that Person can start buying or selling books.		Medium	3.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
12	As an Admin I want to be able to download report of a book So that I can inspect certain stats about that book		Medium	5.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
13	As an Admin I want to be able to terminate accounts so that I can remove offending accounts. (after account registration)		Medium	5.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
15	As a public user I want to browse books based on author, ISBN or book title by entering into the search field so that I can quickly find the book based on different search criteria.		Critical	5.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
16	As a public user I want to browse books based on categories by selecting a dropdown menu so that I can quickly find the book of my favourite categories.		Critical	5.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
17	As a public user I want to add a book to my cart so that I can keep track of the book I want to buy.		Critical	8.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.

18 As a public user I want to publish my used book to the website so that I can advertise my books to other users.	Critical	3.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
19 As a public user I want to add a review to a user so that I can let other people know about the service the user provides.	Medium	8.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
20 As a public user I want to edit book details so that I can display the most up-to-date information I want for the book.	High	3.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
21 As a public user I want to receive notification when someone makes a purchase of my published books so that I can take actions such as delivering the books to the buyer.	Critical	8.00	To Do	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
22 As a public user I want to add a book to my cart and buy books so that I don't have to go to the bookstore to buy books.	Critical	8.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
23 As a public user, I want to register my account so that I can start using the system.	Critical	5.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
24 As an admin/shop owner/public user, I want to see my profile information so that I can confirm that all of my information is correct.	Critical	5.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
25 As a public user, I want to login my account so that I can start using the system.	Critical	5.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
26 As a public user, I want to see the contact us page so that I can know how to contact and give feedback	Low	3.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.
27 As a public user, I want to see the about us page so that I can know more information about the platform	Low	3.00	Done	Unit tests have been written and passed. Code is well formatted and suitable code comments are provided. Acceptance criteria for the User Stories is met. Signed off by Product Owner. Code review is completed.

SPRINT PLANNING

Sprint 3

1. Goal

- Allow Admin to approve shop owners.
- Allow users/shop owners to access their transaction history.

2. Duration of the sprint

2 weeks

3. What is the team's vision for this sprint?

- *The items committed are 6, 7, 22 because these are CRUD operations any users will need this functionality (for example adding a book to the cart and buying books).*
- *Potentially shippable product:*
- *Admin can approve shop owners so that only legal users can use the platform.*
- *Users/shop owners can access their transaction history.*

4. Estimation in story points

1. User story 7

As an Admin I want to be able to approve shop owners so that I can allow only legal users to be members.

Estimation point: 5

Justification: Need to implement a react page to approve shop owners and an API (GET request) to get all the pending shop owners and an API (PUT request) to approve the shop owners.

2. User story 6

As a public user/shop owner, I want to see my transaction history so that I can keep track of the books I have purchased or sold.

Estimation point: 5

Justification: Need to implement a react page to display the transaction history and an API (GET request) for the books purchased and sold.

Sprint 4

1. Goal

- Finish documentation
- Successful deployment of the Frontend and Backend.
- Refactoring code.
- Write more unit tests
- Allow users to add books to the cart and purchase them online.

2. Duration of the sprint

2 weeks

3. What is the team's vision for this sprint?

- *Potentially shippable product:*
- *Complete documentation and making sure that we haven't missed any necessary documents*
- *Making sure that the our code is readable and has meaningful comments*
- *Writing unit tests to make sure that our product does not crash unexpectedly and behave weirdly.*
- *Users can add a book to their cart and checkout.*

4. Estimation in story points

1. User story 22

As a public user, I want to add a book to my cart and make the payment online using my credit card so that I don't have to go to the bookstore to buy books.

Estimation point: 8

Justification: Need to implement a react page for users to add their books and an API (POST request) to buy the books.

SPRINT REVIEW

Sprint 3

Sprint Goal

- The initial goal of this sprint was to finish documentation, finish writing up unit tests to test both frontend and backend, refactor code and successfully deploy the frontend and the backend of our product.

Completed Tasks

- We were able to complete all the tasks we were assigned, that includes: unit tests, refactoring and the one user stories.

What went well?

- Completed all the user stories that we planned.
- Maintained communication with team members
- Was able to avoid mistakes we made in the earlier sprints

What problems were faced and how were they resolved?

- Sprint 3 went pretty well, probably we underestimate our sprint velocity a little, however, we manage to complete all the critical user stories.

Next Sprint 4 start date:

- 1/10/21

Sprint 4

Sprint Goal

- The initial goal of this sprint was to finish documentation, finish writing up unit tests to test both frontend and backend, refactor code and successfully deploy the frontend and the backend of our product.

Completed Tasks

- We were able to complete all the tasks we were assigned, that includes; documentation, deployment, unit tests, refactoring and the two user stories.

What went well?

- Completed all the user stories that we planned.
- Maintained communication with team members
- Was able to avoid mistakes we made in the earlier sprints

What problems were faced and how were they resolved?

- We had some problems with deployment of the APIs and integrating backend and frontend, so we did some research on the internet and asked our tutor/lecturer to resolve the problem.

SPRINT RETRO

Sprint 3:

Bookeroo Sprint Retro Notes

Team: Team 5

Sprint: 3

Date: 04/10/21

Attended: Tuan Vu, Phu Nguyen, Janidu Higgoda, Edward Kahiro Kuo

Scrum Master: Tuan Vu

Product Owner: Mohamad Ali

Development team: Tuan Vu, Phu Nguyen, Janidu Higgoda, Edward Kahiro Kuo

1. Things That Went Well

- Complete a user story and avoid the mistake that we made in Sprint 1.

2. Things That Could Have Gone Better

- We could have completed more user stories, (we underestimate the sprint team velocity).
- Making less CI fails.

3. Things That Surprised Us

- How fast time flies by.
- Complexity in dockerisation.

4. Lessons Learned

- Keeping a steady development pace is important.
- Keep naming convention consistent between microservices.

5. Final Thoughts

- We have learnt our mistakes in Sprint one and improve, we avoid underestimating the complexity of user stories.

Sprint 4:

Bookeroo Sprint Retro Notes

Team: Team 5

Sprint: 4

Date: 22/10/21

Attended: Tuan Vu, Phu Nguyen, Janidu Higgoda, Edward Kahiro Kuo

Scrum Master: Tuan Vu

Product Owner: Mohamad Ali

Development team: Tuan Vu, Phu Nguyen, Janidu Higgoda, Edward Kahiro Kuo

1. Things That Went Well

- Deployment of FE and BE to AWS.

- Finish the last two user stories.

2. Things That Could Have Gone Better

- Setting up our database on RDS
- Free tier in AWS

3. Things That Surprised Us

- IP being dynamic in ECS tasks
- Target groups in Load Balancer being confusing
- AWS costing more than expected

4. Lessons Learned

- Learn to communicate effectively.
- Estimate sprint velocity more accurately.

5. Final Thoughts

- We have learnt our mistakes and improved our performance over each sprint.

COMMUNICATION LOG

22 September 2021

Tuan Vu 22/9 4:51 pm

Hi team, Sprint 3 tasks have been put on Jira board, please remember to pull from Develop and branch out from it, please put in the effort incrementally maybe 1-2 hrs a day please let the team know if you have any trouble and or roadblock in completing your task and we will redistribute the task and allocate more resource. I really value the communication so if we all communicate effectively we will all get fair contribution at the end rather than calculate each person contribution individually.

Phu Nguyen 21/9 5:35 pm

Edward Khiro Kuo hey man I'm starting the development for the transaction ms. However we would need to discuss a bit on how to handle the shared database between the ms. Let me know whenever you're free to meet.

▼ Collapse all

Edward Khiro Kuo 21/9 5:37 pm
Tomorrow after work?

1

Phu Nguyen 21/9 5:39 pm
yeah no wr. so what time?
I think the approach in the post I sent u yesterday is quite simple for us to integrate. I'm cloning his git and trying it out. Probably can start using it in our project by tmr.

Edward Khiro Kuo 22/9 8:20 pm
Phu Nguyen Are you free?

Phu Nguyen 22/9 9:26 pm
Just having dinner now. I'll finish in ab an hour. Could we meet then?

1

Edward Khiro Kuo 22/9 10:15 pm
Phu Nguyen I can meet briefly

Phu Nguyen 22/9 10:35 pm
Edward Khiro Kuo can we meet now?

1

↪ Reply

Yesterday

Edward Khiro Kuo Sunday 9:17 pm

Guys, I haven't been feeling well since taking the vaccine so there's not much that I have worked on for now, but I will try to catch up again once I get better.

1 1

TV 22/9 Yesterday 8:47 am Edited
no worries bro take care, I'll do some research in BE deployment

1

↪ Reply

Janidu Higgoda 24/9 7:34 pm
i have implemented the shopping cart page and order history page. i have also rendered the navbar for the shopping cart icon to be displayed upon login.

1

↪ Reply

Tuan Vu 24/9 7:36 pm
Janidu Higgoda can you make PRs into Develop branch and ask for reviewer ?

@

▼ Collapse all

JH Janidu Higgoda 24/9 7:37 pm
yep, i will do that now

TV Tuan Vu 24/9 7:37 pm
thanks bro

↪ Reply

Tuan Vu 23/9 8:36 pm
Hi backend team, I also need the endpoint to get all the pending shop owners please implement and fill in the docs, Phu Nguyen Edward Khiro Kuo

▼ Collapse all

EK Edward Khiro Kuo 23/9 8:42 pm
Hi, it hasn't been implemented yet. I'll create a ticket for it.

TV Tuan Vu 23/9 8:43 pm
all good thanks Edward

PN Phu Nguyen 24/9 5:50 pm
Tuan Vu this backend endpoint is done and I added the GET request on the integration doc.

EK Edward Khiro Kuo 24/9 7:06 pm
Phu Nguyen Thanks Phu.

1

TV Tuan Vu 24/9 7:16 pm
awesome thanks Phu Nguyen

1

EK Edward Khiro Kuo 24/9 7:28 pm
I think I might need to create a new email or turn off email notifications cause my inbox is clogged with github right now.

1

PN Phu Nguyen 24/9 7:29 pm
I think you can filter all github mails to a folder in your inbox automatically

1

PN Phu Nguyen 24/9 7:35 pm
Edward Khiro Kuo go to your outlook on web, click on setting wheel on top right, then "View all Outlook settings" on the bottom.

See more

TV Tuan Vu 24/9 7:40 pm
hey Phu Nguyen you forgot to add what the endpoint returns

PN Phu Nguyen 24/9 8:26 pm
Tuan Vu oh yeah. it would be exactly the same as getAllUser

EK Edward Khiro Kuo 24/9 9:39 pm
I'm not using outlook for github 😞
But I'll try to find a way

10 October 2021

Phu Nguyen 6/10 7:10 pm

Tuan Vu all the GET requests endpoint are fixed and added, I've put the JSON return on the integration doc so you can check if the return info is sufficient. Still need to fix CI, add security, data validation and unit tests, but the basic functionality is done.

▼ Collapse all

Tuan Vu 6/10 7:37 pm

awesome thanks Phu I'll try to do the integration

1

Tuan Vu 8/10 4:49 pm

Hey Phu Nguyen

1

Can you also add the books information for each order ? I will need the book title, book author, book image and short description

Phu Nguyen 8/10 4:51 pm

ok sure.

1

Phu Nguyen Sunday 5:51 pm

Tuan Vu alright I got the additional fields in. Updated the integration doc. Should be good to go for tonight integration.

Tuan Vu Sunday 7:19 pm

great thanks Phu Nguyen 😊

↪ Reply

Today

Tuan Vu 10:00 am

hi team, tomorrow we will integrate all the features into develop, Phu Nguyen have you got a chance to fix the CI for transaction MS ?

Phu Nguyen 10:12 am

been so busy with the CT A2 T.T but I'll take today to get it done. We should be good to go for fully integration tmr.

1

↪ Reply

Tuan Vu 5:56 pm

Hi team I have put up the slide template on our drive please fill your part when you have a chance

Tuan Vu 9:01 pm

Hi team, let me know if you guys are free to meet tomorrow at 11:00 AM

2

↪ Reply

Phu Nguyen 3/10 1:54 am

Edward Khiro Kuo ping me whenever you have some free time. I need your help troubleshooting some issue 😊

▼ Collapse all

Edward Khiro Kuo 3/10 7:24 am

Sorry guys I won't be on much since my sickness reappeared, I'll try to help out when I can. I saw a ticket assigned to you regarding backend database, are you currently doing it? I'm currently working on the database access for the docker.

Phu Nguyen 3/10 11:03 am

Edward Khiro Kuo the database is just like we discussed that we still use the other ms as dependency so that ticket is basically finished. I'm having issue calling the API from postman, keep getting 404 so if you could help debug then that would be great.

Phu Nguyen 3/10 11:16 am

Imao just fixed it. no worries Edward Khiro Kuo.

1

Edward Khiro Kuo 3/10 7:17 pm

Sorry I meant the dockerisation of the database

Phu Nguyen 3/10 7:50 pm

Edward Khiro Kuo yeah I havent working on that yet so please do

↪ Reply

Edward Khiro Kuo Thursday 4:57 pm

I've deployed our DB to RDS using aurora, configuring docker for deployment and ECS now. Also, another handy function on IntelliJ, you can connect to everything, database and also run docker on it.

1

See more

▼ Collapse all

Edward Khiro Kuo Thursday 8:25 pm

Did anyone change the docker settings at all? Phu Nguyen

Phu Nguyen Thursday 8:52 pm

Edward Khiro Kuo hmm I didnt touch it. Is there anything wrong?

Edward Khiro Kuo Thursday 9:27 pm

Phu Nguyen for some reason the docker is all broken

Phu Nguyen Thursday 9:28 pm

Edward Khiro Kuo you want to meet now and fix it together?

Edward Khiro Kuo Thursday 9:29 pm

Sure

Phu Nguyen Thursday 9:29 pm

Alright see you in Discord channel. I'll join u in a sec.

Tuan Vu Yesterday 9:14 am

Great stuff Edward Khiro Kuo 😊 rn please spin up and test the api, you can disable security for now, and let me know the domain of the API for loginms, bookms, and transaction ms

Edward Khiro Kuo Yesterday 11:57 am

The docker is fixed and integrated with DB, now I'm figuring out how to deploy.

Tuan Vu Monday 7:44 pm
hi team, I cannot test the backend on my localhost with the branch Develop. we will need to meet on Wednesday to the integration again, either Phu Nguyen or Edward Khiro Kuo please check the backend code

▼ Collapse all

 **Edward Khiro Kuo** Monday 7:44 pm
Tuan Vu what's wrong with it?

 **Tuan Vu** Monday 7:45 pm
the seeding data doesn't work, I tried register a new user but it doesn't work too

 **Edward Khiro Kuo** Monday 7:47 pm
Tuan Vu Did you try the usual login->book->transaction

Tuan Vu I think I know what's causing this. Can you try changing the ddl auto to 'create' in the application properties. And comment out the * in the configuration files in book transaction.

So all 3 microservices have create ddl auto.

 **Tuan Vu** Monday 7:54 pm
I got this error when I comment out the user configuration file

```
@Bean  
CommandLineRunner seedUsers(UserRepository userRepository, RoleRepository roleRepository){  
    return args -> {  
        Could not autowire. No beans of 'UserRepository' type found.  
        Role adminRole = Role.builder().code("ROLE_ADMIN").name("Admin").build();  
        Role userRole = Role.builder().code("ROLE_PUBLIC").name("Public User").build();  
        userRepository.save(adminRole);  
        userRepository.save(userRole);  
    };}
```

 **Edward Khiro Kuo** Monday 7:54 pm
Tuan Vu try running it anyway

 **Tuan Vu** Monday 7:56 pm
all good now thanks bro !!

Hi team, we will integrate docs on Friday and do the presentation rehearsal on Sunday this week please prepare for it, Phu Nguyen **Janidu Higgoda** I know its stressful as many Assignment is due, please let me know if you need me with OSP I'm happy to help

↪ Reply

Edward Khiro Kuo Wednesday 7:37 pm
So guys, my services on aws got terminated because of billing. Apparently I chose the wrong options for rds and fargate causing my bill to blow up so I had to remove everything but I'm setting it all back up tonight. **Tuan Vu** what did you choose for the ecs cluster and service? network + linux?

▼ Collapse all

 **Tuan Vu** Wednesday 8:03 pm
I'm using fargate, this cluster template, it costs me around 11 dollars now, I think we only need it for the demo and testing, so you can spin up, test and then turn off then on demo day turn it on, you can take some screenshots in case we cannot turn it on for demo day. The bill I think we should divide equally in the end Phu Nguyen **Janidu Higgoda**

See more

 **Edward Khiro Kuo** Wednesday 9:12 pm
Ok, I've redeployed everything. The services should be running perfectly on AWS now.

Tuan Vu Phu Nguyen **Janidu Higgoda** Can you guys approve the PR so we can automate all deployments
https://github.com/s3516565/SEPT_TeamProject_Sem2_2021/pull/100

 **Tuan Vu** Wednesday 9:16 pm
the IP is the same **Edward Khiro Kuo** ?

 **Edward Khiro Kuo** Wednesday 9:18 pm
Tuan Vu yes. The IP is an elastic IP mapped to the load balancer.

↪ Reply

Tuan Vu Wednesday 9:04 am
hey **Edward Khiro Kuo** please let me know how it goes with the backend deployment I may need to meet with you today or tmr to complete the ci/cd

▼ Collapse all

 **Edward Khiro Kuo** Wednesday 9:20 pm
I didn't see your message. Did you still need to meet? I'm free after work tomorrow. I will be doing documentations tomorrow.

 **Tuan Vu** Wednesday 9:21 pm
no worries all good 😊

↪ Reply

Tuan Vu Monday 8:53 pm
hey man Edward Khiro Kuo look like its the error with how we set up, I tried testing it with Postman, and it did not work, maybe you can fix it from Postman first

▼ Collapse all

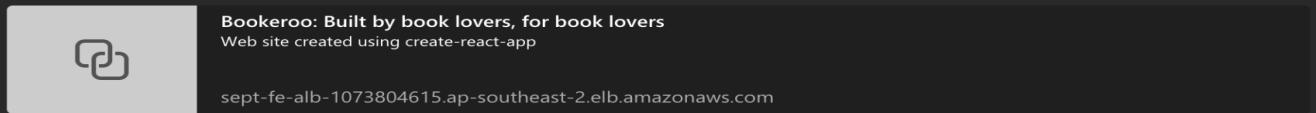

Edward Khiro Kuo Tuesday 11:49 am
There's something weird going on with the database integration. I'm checking it.

Edward Khiro Kuo Tuesday 1:37 pm
Tuan Vu Found the fix. I will be deploying it later today along with the CD docker for transaction.

Tuan Vu Wednesday 3:37 pm
hey Phu Nguyen please add me as github repo admin I need to set up CD

▼ Collapse all

Edward Khiro Kuo Wednesday 3:57 pm
Last time we tried but we couldn't. Admins are only for github enterprise.

Phu Nguyen Wednesday 4:01 pm
Tuan Vu ey last time we tried but sady Github does not let me. If u need to add anything, please let me know and I'll them for you asap.

Tuan Vu Wednesday 4:05 pm Edited
can you please add AWS access key to github actions, you can name the variable whatever you like and let me know , thanks:
AWS access key ID: AKIAJFSENGNBC3LZO6E
AWS secret: /QOT6AhZTCv6fIMlh4+FsQ4gyqDDXAaYVvjczUg

Tuan Vu Wednesday 6:34 pm
Phu Nguyen how it's going ?

Phu Nguyen Wednesday 7:07 pm

Tuan Vu Monday 5:02 pm
hey Edward Khiro Kuo , I tried to test the backend on localhost but the database has not been seeded,

```
server.port=8080  
  
# Local SQL configuration  
spring.datasource.url=jdbc:mysql://localhost:3306/bookeroo  
spring.datasource.username=root
```

See more

Edward Khiro Kuo Wednesday 11:10 pm
Thanks Tuan Vu, you too! And everyone else! I've approved the PRs and merged the relevant changes, so we're all good now.

Edward Khiro Kuo Wednesday 11:22 pm
I found some errors on the website, not sure if this was intended. The address and phone doesn't change when you change on the profile menu. Also, when inputting invalid ISBN, it doesn't save, but it doesn't tell you anything.

Tuan Vu Wednesday 11:23 pm
I see lets me fix that

1

Edward Khiro Kuo Wednesday 11:24 pm
Also, there is a small problem with the display which I think might be caused by the backend aws latency, but I don't think there's anything we can do with that except refreshing the page. The ecs also boots up a bit slow when it starts after being redeployed.

Tuan Vu Wednesday 11:26 pm
profile change has not been implemented I think, but I'll add more custom error box

1

Edward Khiro Kuo Wednesday 11:27 pm
Thanks.

1

Wednesday 11:28 pm
Hopefully it's not too much trouble.

REFACTORING REPORT

Frontend:

1. Use React html properties keyword

Some properties keywords in HTML generated warnings with React were omitted such as class and for. These keywords are replaced with className and htmlFor respectively.

Use className instead of class to avoid warnings

```
<div className="order-item" key={index}>
  {" "}
  <hr></hr>
```

Use htmlFor instead of for to avoid warnings

```
<label htmlFor="long description">Long Description</label>
<textarea
```

2. Remove warning by adding comment “eslint-disable-next-line react-hooks/exhaustive-deps”

```
useEffect(() => {
  window.scrollTo(0, 0);
  searchViewBook(location.state.bookID, history);
  // eslint-disable-next-line react-hooks/exhaustive-deps
}, [ ]);
```

3. Put all endpoints into a single file.

```
1  export const bookEndpoint = "http://localhost:8090/api/";
2  export const userEndpoint = "http://localhost:8080/api/";
3  export const transactionEndpoint = "http://localhost:8070/api/";
```

4. Format with npm prettier

```
"scripts": [
  "start": "react-scripts start",
  "build": "react-scripts build",
  "test": "react-scripts test -u",
  "eject": "react-scripts eject",
  "deploy:dev": "aws s3 sync build s3://sept-ted-vu-static-hosting",
  "lint:check": "eslint --fix \"./**/src/**/*.{js,jsx}\\"",
  "format:check": "prettier --check \"./**/src/**/*.{js,jsx}\\"",
  "lint:fix": "eslint \"./**/src/**/*.{js,jsx}\\"",
  "format:fix": "prettier --write \"./**/src/**/*.{js,jsx}\\""
],
```

The code is formatted with npm prettier which is configured in the CI.

5. Running lint check with ESLint.

```
"scripts": [
  "start": "react-scripts start",
  "build": "react-scripts build",
  "test": "react-scripts test -u",
  "eject": "react-scripts eject",
  "deploy:dev": "aws s3 sync build s3://sept-ted-vu-static-hosting",
  "lint:check": "eslint --fix \"./**/src/**/*.{js,jsx}\\"",
  "format:check": "prettier --check \"./**/src/**/*.{js,jsx}\\"",
  "lint:fix": "eslint \"./**/src/**/*.{js,jsx}\\"",
  "format:fix": "prettier --write \"./**/src/**/*.{js,jsx}\\""
],
```

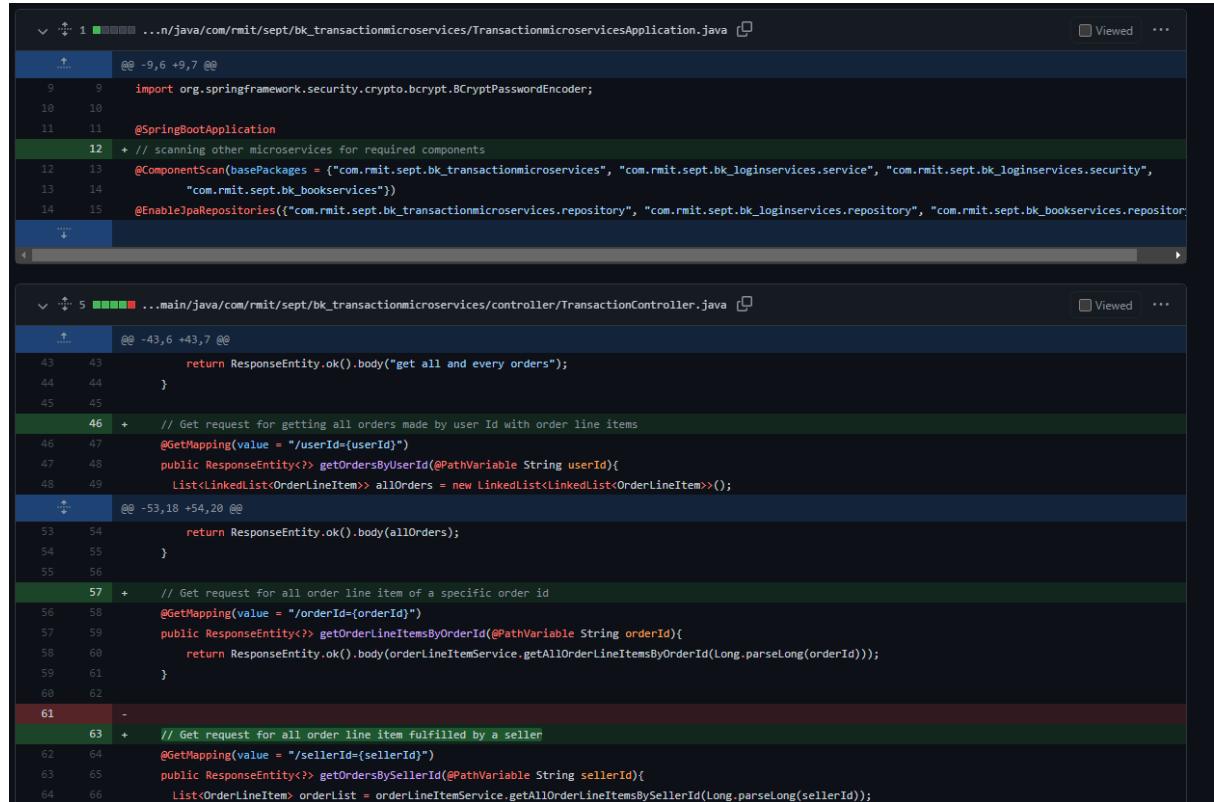

The code syntax is checked with ESLint.

6. Refactor into functional components.

Components have been refactored to use functional components.

Backend:

1. Add comments:

The screenshot shows a code diff interface comparing two Java files. The top file is `...n/java/com/rmit/sept/bk_transactionmicroservices/TransactionmicroservicesApplication.java` and the bottom file is `...main/java/com/rmit/sept/bk_transactionmicroservices/controller/TransactionController.java`. The code in both files includes annotations like `@SpringBootApplication`, `@ComponentScan`, and `@EnableJpaRepositories`. The `TransactionController.java` file contains several methods with detailed comments explaining their purpose, such as getting all orders by user ID and getting all order line items by order ID. The code is annotated with `@GetMapping` and `@PathVariable`.

```
...n/java/com/rmit/sept/bk_transactionmicroservices/TransactionmicroservicesApplication.java
...
import org.springframework.security.crypto.bcrypt.BCryptPasswordEncoder;
...
@SpringBootApplication
@ComponentScan(basePackages = {"com.rmit.sept.bk_transactionmicroservices", "com.rmit.sept.bk_loginservices.service", "com.rmit.sept.bk_loginservices.security", "com.rmit.sept.bk_bookservices"})
@EnableJpaRepositories({"com.rmit.sept.bk_transactionmicroservices.repository", "com.rmit.sept.bk_loginservices.repository", "com.rmit.sept.bk_bookservices.repository"})

...main/java/com/rmit/sept/bk_transactionmicroservices/controller/TransactionController.java
...
return ResponseEntity.ok().body("get all and every orders");
}
...
// Get request for getting all orders made by user Id with order line items
@GetMapping(value = "/userId")
public ResponseEntity<?> getOrdersByUserId(@PathVariable String userId){
    List<OrderLineItem> allOrders = new LinkedList<OrderLineItem>();
    ...
    return ResponseEntity.ok().body(allOrders);
}
...
// Get request for all order line item of a specific order id
@GetMapping(value = "/orderId={orderId}")
public ResponseEntity<?> getOrderLineItemsByOrderId(@PathVariable String orderId){
    return ResponseEntity.ok().body(orderLineItemService.getAllOrderLineItemsById(Long.parseLong(orderId)));
}
...
// Get request for all order line item fulfilled by a seller
@GetMapping(value = "/sellerId={sellerId}")
public ResponseEntity<?> getOrdersBySellerId(@PathVariable String sellerId){
    List<OrderLineItem> orderList = orderLineItemService.getAllOrderLineItemsBySellerId(Long.parseLong(sellerId));
}
```

2. Changing naming convention for code readability:

```
// get all order line items by a specific order id
public List<OrderLineItem> getAllOrderLineItemsByOrderId(long orderId){
    List<OrderLineItem> allOrderLineItems = orderLineItemRepository.findAll();
    List<OrderLineItem> orderLineItemsByOrderId = new LinkedList<OrderLineItem>();
    for (OrderLineItem orderLineItem : allOrderLineItems) {
        if (orderLineItem.getOrderId() == orderId) {
            orderLineItemsByOrderId.add(orderLineItem);
        }
    }
    return orderLineItemsByOrderId;
}

// get order line item by specific seller id
public List<OrderLineItem> getAllOrderLineItemsBySellerId(long sellerId){
    List<OrderLineItem> allOrderLineItems = orderLineItemRepository.findAll();
    List<OrderLineItem> orderLineItemsBySellerId = new LinkedList<OrderLineItem>();
    for (OrderLineItem orderLineItem : allOrderLineItems) {
        if (orderLineItem.getSellerId() == sellerId) {
            orderLineItemsBySellerId.add(orderLineItem);
        }
    }
    return orderLineItemsBySellerId;
}
```

Vision Statement

Our target customers:

- Public users: People who want to find their favorite books with a suitable price.
- Publisher: Popular publisher as well as self-publisher.

Our vision statement:

“To provide a platform for users to find books with suitable prices and incentivize self-publishers/novelists to bring their books to the audience.”

TESTING DOCUMENTATION

Testing Documentation

Type of testing conducted:

- Unit testing

- Integration testing
- Browser testing
- Mobile device compatibility testing
- Smoke testing
- Acceptance testing

1. Unit testing:

Frontend

- **Test location:** SEPT_TeamProject_Sem2_2021/FrontEnd/myfirstapp/src/test
- **Test strategy:**
The full implementation of tests can be found in the above location here are some screenshots of the tests:
 - Test the rendering of each element

```
test("Render without crashing", () => {
  render(
    <BrowserRouter>
      <ShoppingCartPlain />
    </BrowserRouter>
  );
});
```

```
test("renders without crashing", () => {
  render(
    <BrowserRouter>
      <Card bookProps={book} />{" "}
    </BrowserRouter>
  );
});
```

- o Test if element renders the props received correctly.

```
test("Render container element", () => {
  const { getByTestId } = render(
    <BrowserRouter>
      <ShoppingCartPlain />
    </BrowserRouter>
  );
  const element = getByTestId("container");
  expect(element).toBeInTheDocument();
});
```

```
test("renders card title element with correct content", () => {
  const { getByTestId } = render(
    <BrowserRouter>
      <Card bookProps={book} />{" "}
    </BrowserRouter>
  );
  const titleElement = getByTestId("card-title-element");
  expect(titleElement).toHaveTextContent(book.title);
});
```

- o Snapshot testing (the snapshots are placed are in __snapshot folder and placed under the test folder)

```
test("matches snapshot", () => {
  const tree = renderer
    .create(
      <BrowserRouter>
        <ShoppingCartPlain />
      </BrowserRouter>
    )
    .toJSON();

  expect(tree).toMatchSnapshot();
});
```

```
// snapshot testing
test("matches snapshot", () => {
  const tree = ReactTestRenderer.create(
    <BrowserRouter>
      <Card bookProps={book} />{" "}
    </BrowserRouter>
  ).toJSON();

  expect(tree).toMatchSnapshot();
});|
```

- **Test execution**

The unit test for Frontend consists of 18 test suites with 83 tests.

```
Test Suites: 18 passed, 18 total
Tests:       83 passed, 83 total
Snapshots:   3 written, 10 passed, 13 total
Time:        10.551s
Ran all test suites.
```

[Watch Usage](#)

Backend

- **Test location:**

SEPT_TeamProject_Sem2_2021/BackEnd/loginmicroservices/src/test

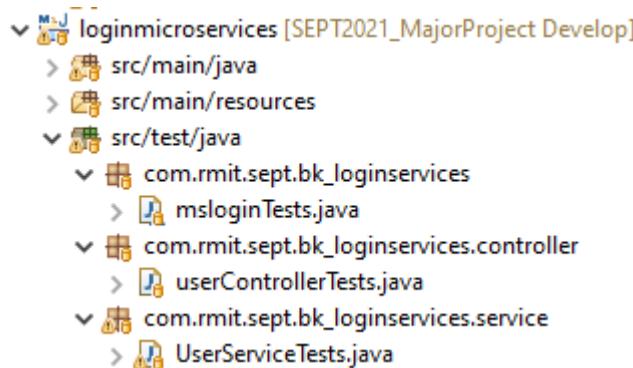

A screenshot of a file explorer interface showing the test directory structure. The path is SEPT_TeamProject_Sem2_2021/BackEnd/loginmicroservices/src/test. The 'bookmicroservices' folder is expanded, showing 'src/main/java', 'src/main/resources', and 'src/test/java'. The 'src/test/java' folder contains two packages: 'com.rmit.sept.bk_bookservices' and 'com.rmit.sept.bk_bookservices.service'. The 'BookServiceTests.java' file is highlighted in the 'src/test/java/com/rmit/sept/bk_bookservices/service' folder.

```

bookmicroservices [SEPT2021_MajorProject Develop]
  > src/main/java
  > src/main/resources
  & src/test/java
    & com.rmit.sept.bk_bookservices
      > BookmicroservicesApplicationTests.java
    & com.rmit.sept.bk_bookservices.service
      > BookServiceTests.java

```

SEPT_TeamProject_Sem2_2021/BackEnd/bookmicroservices/src/test

- **Test strategy:**

The full implementation of tests can be found in the above location here are some screenshots of the tests:

- Test for the method getBookByTitle to throw an exception when an invalid title was given.

```
@Test
void test_getBookByTitle_titleNotExist_fail(){
    doReturn(new ArrayList<Book>()).when(bookRepository).findByTitle(any());
    assertThrows(ItemNotFoundException.class, () -> {
        bookService.getBooksByTitle("invalidTitle");
    });
    verify(bookRepository, times(1)).findByTitle(any());
}
```

- Test to check if the remove book method is working correctly:

```
@Test
void test_removeBook_successful(){
    Book book = Book.builder()
        .userId((long)2)
        .title("Edited book Sword Art Online Progressive, Vol. 1")
        .publishedDate(LocalDate.of(2013, 10, 10))
        .shortDescription("The volume contains Kirito and Asuna's a")
        .longDescription("There's no way to beat this game. The onl")
        .ISBN10("0316259365")
        .coverImageUrl("https://d1w7fb2mkkr3kw.cloudfront.net/asset")
        .price(100)
        .quantity(10)
        .status("New")
        .build();
    doNothing().when(bookRepository).delete(any());
    bookService.removeBook(book);
    verify(bookRepository, times(1)).delete(book);
}
```

- Test when create new user with duplicate username, it would throw the correct exception:

```
@Test
void test_saveUser_duplicateUsername_fail(){
    User user = User.builder().username("test_usernameExists@rmit.com").password("password")
        .givenName("given").surname("sur").build();
    User duplicateUser = User.builder().username("test_usernameExists@rmit.com").password("password")
        .givenName("given").surname("sur").build();
    userRepository.save(duplicateUser);
    assertThrows(UsernameAlreadyExistsException.class, () -> {
        userService.saveUser(user, "ROLE_PUBLIC");
    });
    userRepository.delete(duplicateUser);
}
```

- **Test execution:**

Finished after 6.268 seconds

2. Integration testing

Integration testing is conducted via the integration document where all the endpoints and rules of using the endpoints are listed. This serves as a contract between frontend and backend, here are some endpoint examples in the document.

PUT

```
api/books/edit/{bookId}
```

Note: The data in the payload will overwrite the old data in the DB. If the field is empty or not available in the payload RequestBody, it will overwrite the old data with null. Make sure you have all data in the PUT payload.

Book RequestBody Payload

```
{
  "book": {
    "userId": 2,
    "title": "test fixed",
    "isbn10": "1231231231",
    "isbn13": "1231231231231",
    "longDescription": "test",
    "shortDescription": "test",
    "publishedDate": "2021-01-01",
    "coverImageUrl": "https://something.com/abc.png",
    "status": "NEW",
    "price": 100.0,
```

```
    "quantity": 5
  },
  "authorNames": [
    "Reki Kawahara"
  ],
  "categoryNames": [
    "Romance"
  ]
}
```

```
POST  
api/books/add  
  
Book RequestBody Payload  
{  
    "book":{  
        "userID": 2,
```

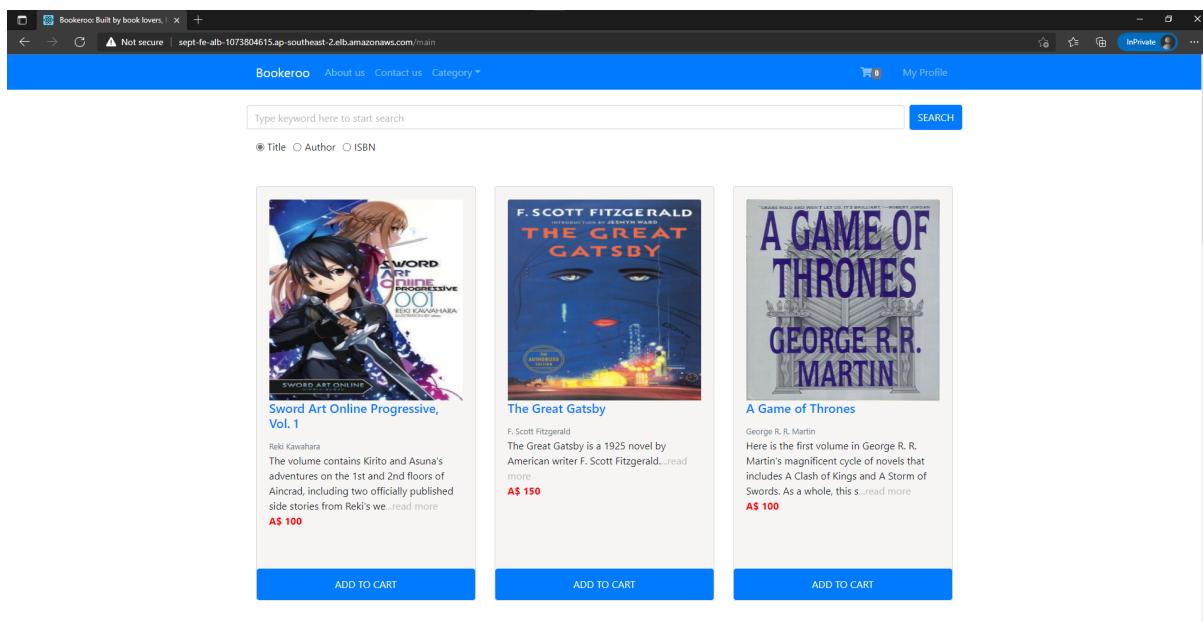

```
        "title": "test",  
        "isbn10": "1231231231",  
        "isbn13": "1231231231231",  
        "longDescription": "test",  
        "shortDescription": "test",  
        "publishedDate": "2021-01-01",  
        "coverImageURL": "https://something.com/abc.png",  
        "status": "NEW",  
        "price": 100.0,  
        "quantity": 5  
    },  
    "authorNames": [  
        "Reki Kawahara"  
    ],  
    "categoryNames": [  
        "Romance"  
    ],  
    "publisherName": "Amazon"
```

3. Browser testing

- **Browser:** Google Chrome and Microsoft Edge
- **Result:** The application is rendered similarly on both browsers.

3.1 Microsoft Edge:

3.1.1 Rendering main page on Microsoft Edge

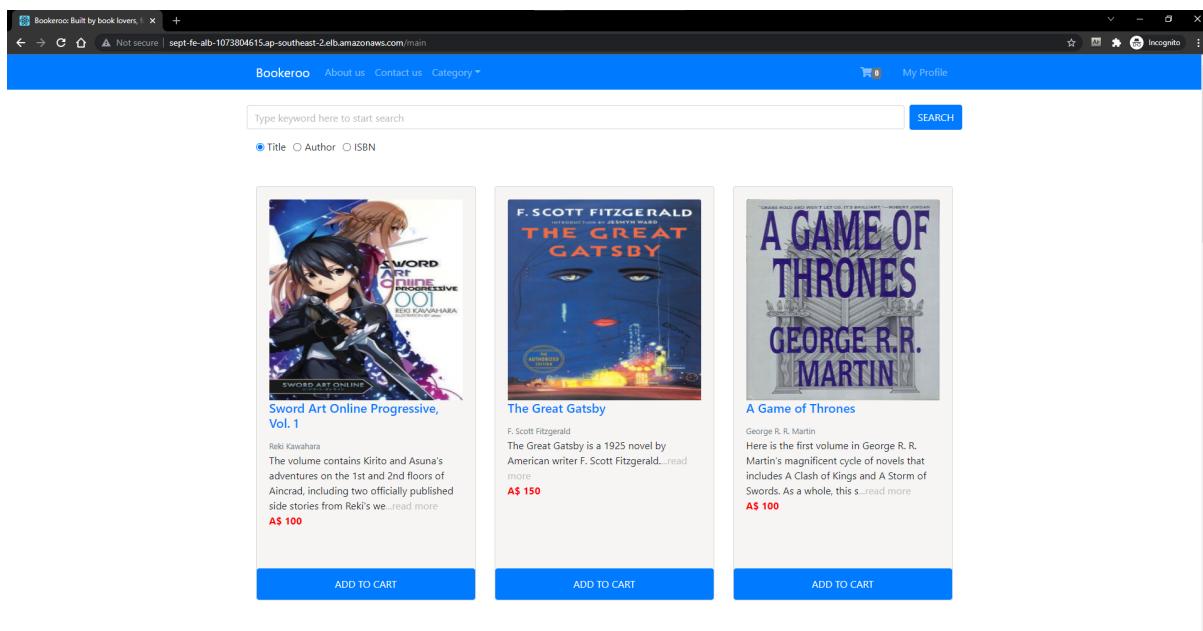

3.1.2 Rendering book page on Microsoft Edge

A screenshot of the Bookeroo website on Microsoft Edge, focusing on the product page for 'The Great Gatsby'. The page features a large image of the book cover, which is a blue-toned illustration of a woman's face with city lights in the background. To the right of the image, the title 'The Great Gatsby' is displayed in bold black text, followed by the author's name 'F. SCOTT FITZGERALD' and a small note 'INTRODUCTION BY JESMYN WARD'. Below the title, there are sections for 'Write a Review' and 'Price: \$ 150'. A 'Status: New' badge is visible. The 'Short Description' section states that it is a 1925 novel by American writer F. Scott Fitzgerald. The 'Long Description' section provides a detailed summary of the plot. The 'Product Details' section lists the publisher as Amazon, ISBN10: 9780743273565, ISBN13: 9780743273565, and the release date as October 10, 2012. A green 'Add to Cart' button is located at the bottom left of the product image.

3.2 Google Chrome:

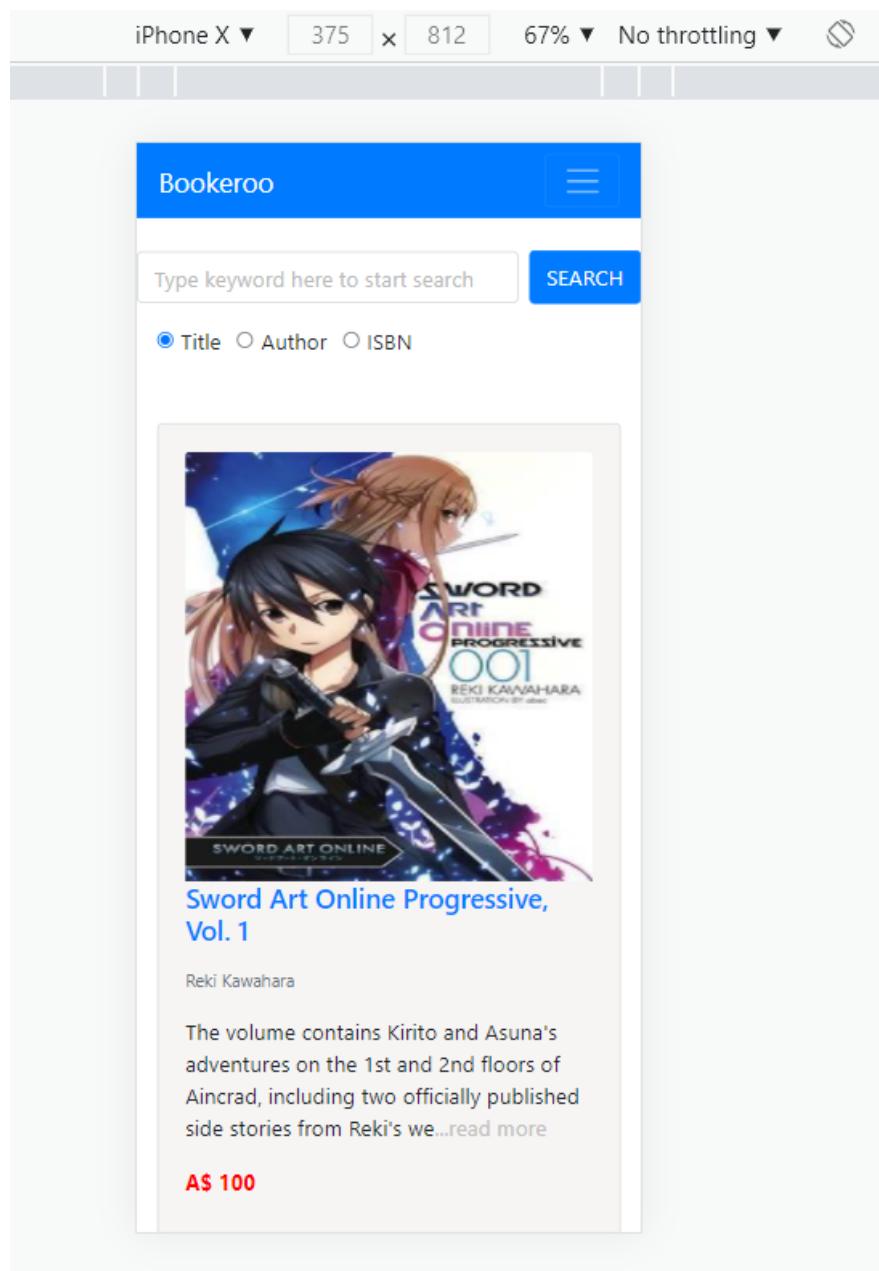

3.2.1 Rendering main page on Google Chrome

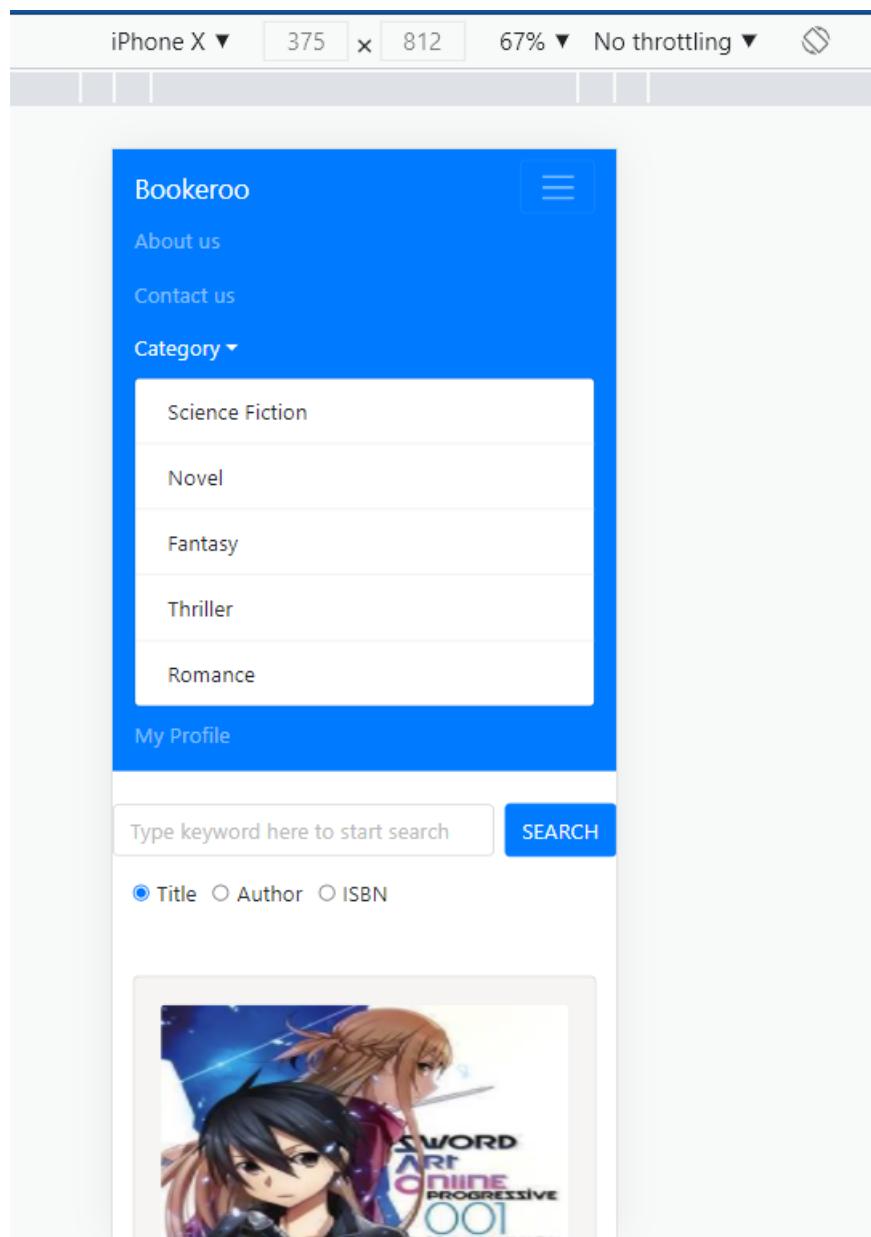

3.2.2 Rendering book page on Google Chrome

4. Mobile Device testing

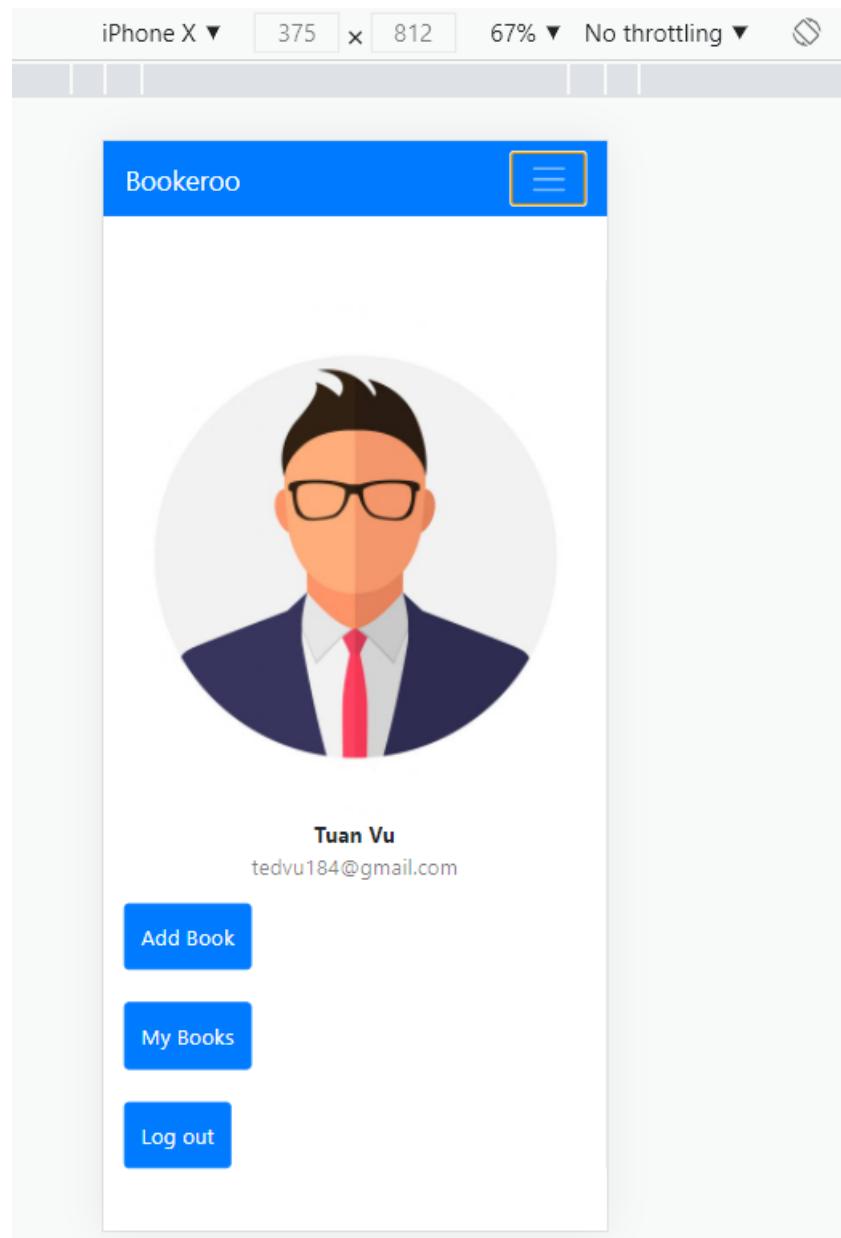

- Tools: Google Developer Tools
- Device: iPhoneX
- Responsive rendering on iPhoneX

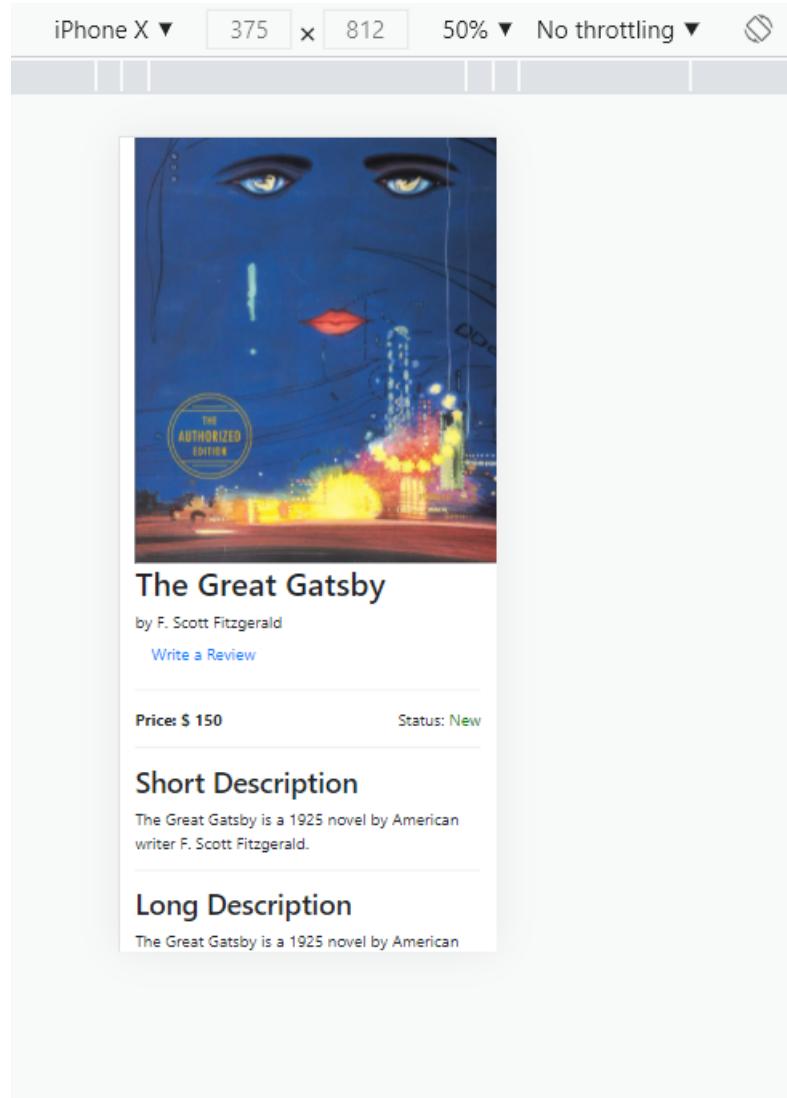

- The main page is rendering correctly, and all components are responsive on the device.

- The main page is rendering correctly, and all components are responsive on the device.

- The profile page is rendering correctly, and all components are responsive on the device.

- The book page is rendered correctly, and all components are responsive on the device.

5. Smoke testing

Here's a list of features that are included in the smoke testing

- Rendering shopping cart on the main page.
- Add a book to the shopping cart.
- Rendering Order history.
- Make a purchase of a shopping cart.

This feature will be tested before signing off with PO.

6. Acceptance testing

User story 7: As an Admin I want to be able to approve shop owners so that I can allow only legal users to be members.

Acceptance test:

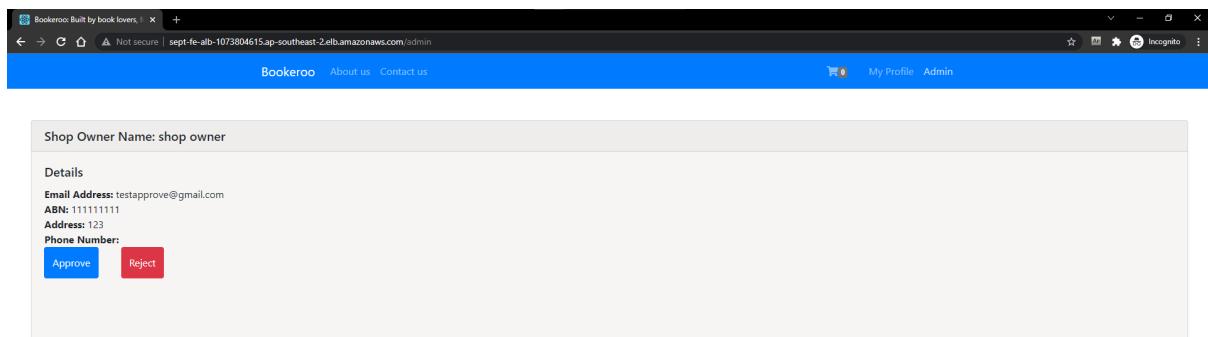

Given the admin has logged in and there is a pending shop owner on the admin page.

When the admin clicks on the approve button

Then the user account is now approved and can log in with correct privilege as shop owner.

How does the implementation pass the acceptance test ?

When the admin login and click on the admin page, he will see the pending shop owners:

Then the admin can click approve to approve this user.

No Pending Shop Owners

The user can now log in:

A screenshot of a web browser window titled 'Bookeroo Built by book lovers.' The address bar shows 'sept-fe-alb-1073804615.ap-southeast-2.elb.amazonaws.com/profile'. The page content shows a user profile for 'shop owner' with email 'testapprove@gmail.com'. On the left, there are navigation buttons: 'Add Book', 'My Books', 'Order History', 'My Sold Books', and 'Log out'. On the right, the 'Edit Account Information' section displays account details: Full Name ('shop owner'), Email ('testapprove@gmail.com'), Address Line ('123'), and Phone Number ('0123456789').

User story 6: As a public user/shop owner, I want to see my transaction history so that I can keep track of the books I have purchased or sold.

Acceptance test:

Given the public user/ shopowner has logged in and went to there profile page

When the admin clicks on the Order History/My Sold Books button

Then the user will see all the books they purchased or sold.

How does the implementation pass the acceptance test ?

When the public user/ shopowner has logged in and went to there profile page

The screenshot shows a web browser window for 'Bookeroo: Built by book lovers.' The URL is 'sept-fe-alb-1073804615.ap-southeast-2.elb.amazonaws.com/profile'. The page has a blue header bar with the 'Bookeroo' logo, 'About us', and 'Contact us' links. On the right, there's a shopping cart icon and 'My Profile'. Below the header is a sidebar with a user profile picture of a person with glasses and a suit, labeled 'public user' and 'user@bookeroo.com'. The sidebar includes buttons for 'Add Book', 'My Books', 'Order History', 'My Sold Books', and 'Log out'. The main content area is titled 'Edit Account Information' under 'Account Information'. It shows fields for 'Full Name' (public user), 'Email' (user@bookeroo.com), 'Address Line', 'Phone Number' (0123456789), and a 'Save' button.

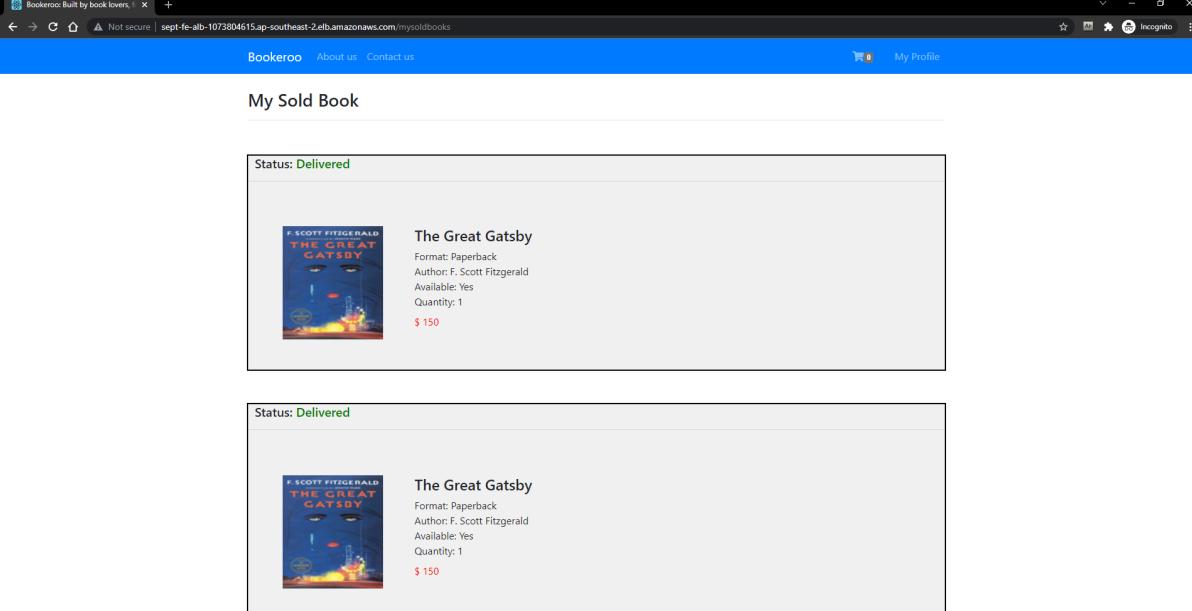

And they click the Order History button, they would see all their past orders:

The screenshot shows a web browser window for 'Bookeroo: Built by book lovers.' The URL is 'sept-fe-alb-1073804615.ap-southeast-2.elb.amazonaws.com/myorders'. The page has a blue header bar with the 'Bookeroo' logo, 'About us', and 'Contact us' links. On the right, there's a shopping cart icon and 'My Profile'. Below the header is a title 'My Orders'. The main content area displays two order items in a table:

Status	Item Details
Delivered	<p>The Great Gatsby Format: Paperback Author: F. Scott Fitzgerald Available: Yes Quantity: 1 \$ 150</p>
Delivered	<p>Sword Art Online Progressive, Vol. 1 Format: Paperback Author: Reki Kawahara Available: Yes Quantity: 1 \$ 100</p>

At the bottom right, there are 'Quantity:' and '2' buttons.

When shop owners click on the My Sold Books button, they would see all their sold books.

The screenshot shows a web browser window for 'Bookeroo: Built by book lovers' at the URL 'sept-fe-alb-1073804615.ap-southeast-2.elb.amazonaws.com/mysoldbooks'. The page title is 'My Sold Book'. There are two identical entries listed:

Status: Delivered

 **The Great Gatsby**
Format: Paperback
Author: F. Scott Fitzgerald
Available: Yes
Quantity: 1
\$ 150

User story 22: As a public user I want to add a book to my cart and buy book online so that I don't have to go to the bookstore to buy books.

Acceptance test:

Given the public user has logged in

When the users add books to cart and click on the pay button

Then the transaction goes through and the user will see all the books they purchased.

How does the implementation pass the acceptance test ?

When the public user add books to there cart, they can see it in there cart

Screenshot of the Bookeroo shopping cart page showing two items: "The Great Gatsby" and "Sword Art Online Progressive, Vol. 1".

The Great Gatsby

Author: F. Scott Fitzgerald
Available: Yes
Quantity: 1
\$ 150

Sword Art Online Progressive, Vol. 1

Author: Reki Kawahara
Available: Yes
Quantity: 1
\$ 100

Delivery: FREE
Total: \$ 250

Buy

When the user clicks on the buy button, the transaction will go through, the order information would show up in both the buyer's order history and seller's sold books history.

Screenshot of the Bookeroo my orders page showing the transaction history.

Status: Delivered

SYSTEM ARCHITECTURE DIAGRAM

SCRUM PROCESS DESCRIPTION

- Our team meets at least twice a week, on Monday and Friday. More details on this could be referred to in the meeting minute part.
- Scrum master would be Ted for most of the time.
- A user story/feature would start in the product backlog in Jira, then moved to the sprint backlog, disassembled into smaller tasks and put in the To do column on Jira board. Then, as the team members worked on the tasks, it would be moved to the In Progress and Task done accordingly. Constant communication and updates would be made in the team scrum meeting, documented in the Meeting Minutes. After a feature is finished with CI/CD passed, the team would do integration and acceptance tests to make sure it complies with all the requirements. Then the pull request would be made and merged into the main code, marking a feature/user story done.

GITFLOW OVERVIEW AND ORGANIZATION

For the development of our program, we have used the gitflow model to organise our code and branches. We have two main branches in which we record the development of our program and merge our changes into, which are the master and develop branch. We start the development of a new feature by creating a new feature branch based on the develop branch, and merging when we finish. Aside from the feature branch, we also have other branches that we use; such as the bugfix, devops, and code review.

A quick summary of all the types of branches we have:

- Master: A full working copy of our program, where everything has been tested and works. Master branch stands at the top and is where we merge the develop branch into once we finish.
- Develop: The main development branch where we have the latest changes from the features which work. The develop branch is one step below the master branch, and is where we merge the changes from our feature branches.
- Feature: The branch where we push our new changes directly into, and requires a pull request to merge into develop. This is where developers directly work on.
- Bugfix: The branch where pushes our fix into, and merge into develop once we finish.
- Codereview: The branch where we do our code reviews and code optimisations, before we merge into develop.
- Devops: The branch where we make changes pertaining to the devops side of our development, such as pipeline (CI CD) changes, and docker related issues.

There is only one master and one develop, but multiple feature, bugfix, devops, and code review branches. We use the prefix feature/branch_name, bugfix/branch_name, devops/branch_name and codereview/branch_name as our naming convention.

Another naming convention that we have decided to adopt pertains to the naming of our development branches. When creating a branch, we also keep the format of:

- branchType/ticketNumber_taskDescription_assignee
- branchType/ticketNumber_assignee_taskDescription

In order to help with our branch organisation and make it easy to identify different branches. We also use a similar naming convention for our commits, where we always start the start of every commit message with the Jira ticket number which is assigned to the branch. This makes every commit message easy to identify and changes easy to keep track of.

DOCKER (BACKEND)

We have decided to dockerise our program to help our deployment. We have a dockerfile in each of our three microservices (loginmicroservices, bookmicroservice, transactionmicroservices), linked together by a docker-compose file in the parent folder of the backend src folder. Each of the dockerfile has an identical structure:

```
FROM maven:3.8.2-jdk-11
RUN mkdir /app

WORKDIR /app

COPY .

RUN mvn -DskipTests=true package

ENTRYPOINT ["java", "-jar", "bookmicroservices/target/bookmicroservices-1.0.0-exec.jar"]
```

The docker first sets /app as the working directory, and copies everything in the root folder, before running a mvn package on the parent service dictated on the parent pom file. This is done because the microservices are dependent on each others' jar files to operate, and therefore require them to be available in the docker to run successfully. The parent pom files allow the jar files of all three microservices to be created and available for each microservice to use. This is also done by setting the build context of the service in the docker-compose file below and adding build dependencies in the services:

```
version: '3'
services:
  login_service:
    build:
      context: ./  

      dockerfile: ./loginmicroservices/Dockerfile  

    image: 580827140556.dkr.ecr.ap-southeast-2.amazonaws.com/bookeroo-login-dev  

    ports:
      - "8080:8080"
  book_service:
    build:
      context: ./  

      dockerfile: ./bookmicroservices/Dockerfile  

    depends_on:
      - login_service  

    image: 580827140556.dkr.ecr.ap-southeast-2.amazonaws.com/bookeroo-book-dev  

    ports:
      - "8090:8090"
  transaction_service:
    build:
      context: ./  

      dockerfile: ./transactionmicroservices/Dockerfile  

    depends_on:
      - login_service
      - book_service  

    image: 580827140556.dkr.ecr.ap-southeast-2.amazonaws.com/bookeroo-transaction-dev  

    ports:
      - "8070:8070"
```

In the docker, we have also set the name of the docker image in accordance with the image name generated in the AWS ECR, and also mapped the ports required for our APIs to function properly.

CI/CD (BACKEND)

We have two files/processes related to the CI/CD pipelines for our backend.

```
# Workflow for Backend
name: CI - Backend (Build Maven package -> Run JUnit test, Build Docker Image)

on:
  push:
    branches:
      - master
  pull_request:
    branches:
      - Develop
      - master

jobs:
  build:
    runs-on:
      ubuntu-latest
    # Service containers to run with `runner-job`
    steps:
      - uses: actions/checkout@v2
      - name: Set up JDK 11
        uses: actions/setup-java@v2
        with:
          java-version: "11"
          distribution: "adopt"
          cache: maven
      - run: cd BackEnd/ && mvn install
      - name: Build LoginMicroservices and run JUnit tests
        run: cd BackEnd/loginmicroservices/ && chmod +x mvnw && ./mvnw package
      - name: Build BookMicroservices and run JUnit tests
        run: cd BackEnd/bookmicroservices/ && chmod +x mvnw && ./mvnw package
      - name: Build TransactionMicroservices and run JUnit tests
        run: cd BackEnd/transactionmicroservices/ && chmod +x mvnw && ./mvnw package
      - name: Build docker images
        id: build-images
        run:
          # Build docker containers
          cd BackEnd/ && docker-compose build
```

The first file, CI-Backend, is mainly used for testing our codes by packaging the maven files, running unit tests, and building the docker images. This CI pipeline is run whenever a change is made in the master branch, or when a pull request is created towards the develop or master branch. This ensures everything works perfectly before merging and prevents broken codes from being merged into our main branches.

```

# Workflow to build backend Docker image on CI server
name: CICD - Backend (Build Docker images and Push to ECR)

on:
  push:
    branches: [Develop]

jobs:
  build:
    runs-on: ubuntu-latest

    steps:
      - name: Checkout
        uses: actions/checkout@v2

      - name: Configure AWS credentials
        uses: aws-actions/configure-aws-credentials@v1
        with:
          aws-access-key-id: ${{ secrets.AWS_ACCESS_KEY_ID }}
          aws-secret-access-key: ${{ secrets.AWS_SECRET_ACCESS_KEY }}
          aws-region: ap-southeast-2

      - name: Login to Amazon ECR
        id: login-ecr
        uses: aws-actions/amazon-ecr-login@v1

      - name: Build and push the images to Amazon ECR
        id: build-deploy-images
        run: |
          # Build docker containers and push them to ECR
          cd BackEnd/ && docker-compose build
          docker push 580827140556.dkr.ecr.ap-southeast-2.amazonaws.com/bookeroo-login-dev
          docker push 580827140556.dkr.ecr.ap-southeast-2.amazonaws.com/bookeroo-book-dev
          docker push 580827140556.dkr.ecr.ap-southeast-2.amazonaws.com/bookeroo-transaction-dev
          # Force services to re-deploy using the new images
          aws ecs update-service --cluster ecs-bookeroo-dev --service bookeroo-service-login --force-new-deployment
          aws ecs update-service --cluster ecs-bookeroo-dev --service bookeroo-service-book --force-new-deployment
          aws ecs update-service --cluster ecs-bookeroo-dev --service bookeroo-service-transaction --force-new-deployment

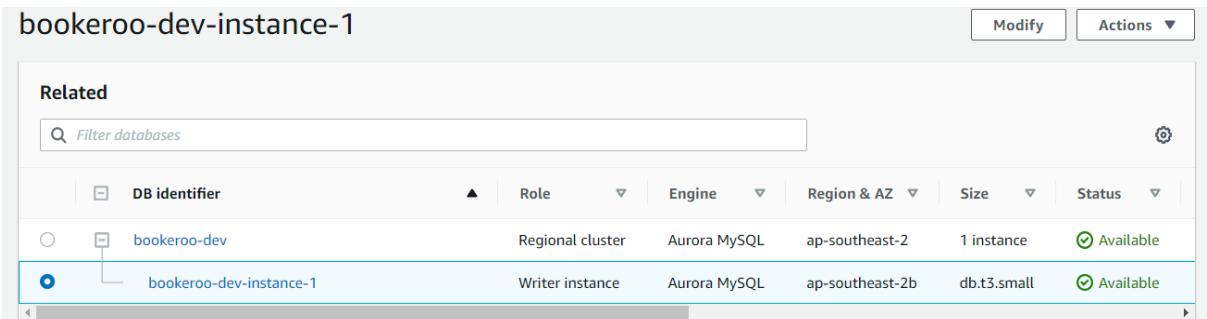

```

The second pipeline is the CICD pipeline used for deploying our services into AWS. This pipeline is run whenever a change happens in the develop branch, mainly after a merge completes from a feature branch. The pipeline starts by configuring the AWS credentials using the keys saved in github, and logging into the account stated. The pipeline then proceeds to build corresponding docker images for the services using the docker-compose file, and push each docker image created into their own AWS ECR repositories. After everything is finished, the pipeline will tell each service in the AWS ECS cluster to force new deployment using the new images uploaded. This will force the service to deploy a new task with all the changes present from the new update.

DEPLOYMENT (BACKEND)

The deployment for the backend system can be largely divided into two parts:

1. Database

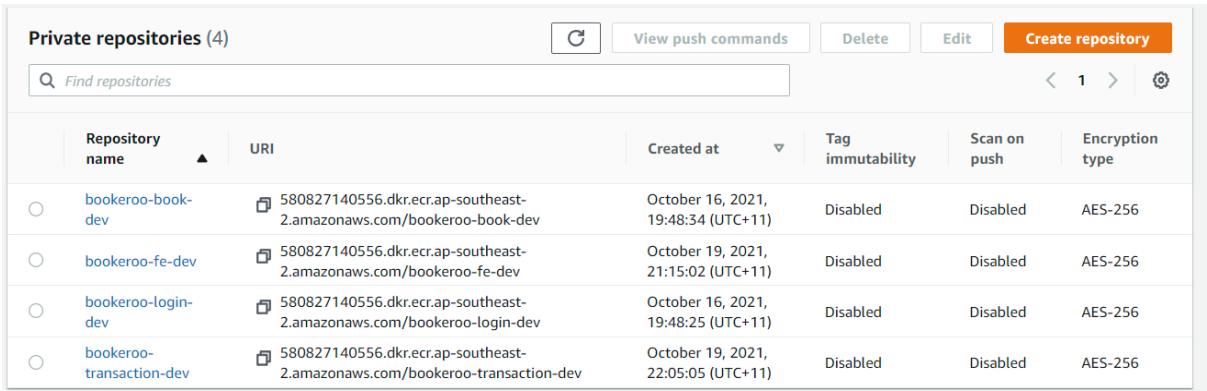

A screenshot of the AWS RDS console. The main title is "bookeroo-dev-instance-1". At the top right are "Modify" and "Actions" buttons. Below the title is a "Related" section with a search bar and a table. The table has columns: DB identifier, Role, Engine, Region & AZ, Size, and Status. It shows two entries: "bookeroo-dev" (Regional cluster, Aurora MySQL, ap-southeast-2, 1 instance, Available) and "bookeroo-dev-instance-1" (Writer instance, Aurora MySQL, ap-southeast-2b, db.t3.small, Available). The "bookeroo-dev-instance-1" row is selected.

This is the simpler of the two and did not require much setup. We have used the Amazon RDS for our database, using the MySQL compatible Amazon Aurora as the engine, as per our previous development of using MySQL database for testing. The process was mostly straightforward, where we just replaced the jdbc connection in our application properties with the mariadb connector to the public DNS we were provided and everything worked perfectly.

2. Service

This is where things got a bit complicated. In order to deploy our services to AWS, there were several things that we had to set up. First was setting up the ECR.

A screenshot of the AWS ECR console. The title is "Private repositories (4)". At the top right are buttons for "View push commands", "Delete", "Edit", and "Create repository". Below the title is a search bar and a table. The table has columns: Repository name, URI, Created at, Tag immutability, Scan on push, and Encryption type. There are four rows, each representing a repository: "bookeroo-book-dev", "bookeroo-fe-dev", "bookeroo-login-dev", and "bookeroo-transaction-dev". Each row shows a unique URI starting with "580827140556.dkr.ecr.ap-southeast-2.amazonaws.com", the creation date, tag immutability status, scan settings, and encryption type (AES-256).

The ECR is basically an image repository for docker images, where we pushed the docker images for our services into.

Task Definitions

Task definitions specify the container information for your application, such as how many containers are part of your task, what resources they will use, how they are linked together, and which host ports they will use. [Learn more](#)

Task Definition		Latest revision status
<input type="checkbox"/>	bookeroo-task-book	ACTIVE
<input type="checkbox"/>	bookeroo-task-login	ACTIVE
<input type="checkbox"/>	bookeroo-task-transaction	ACTIVE

We then had to create a task definition for each of our services, where we define the resources required to run the task, also the ports and which docker image to run within the task. We listed the url for our ECR docker images in their corresponding task definitions in order for them to work correctly.

Clusters > ecs-bookeroo-dev

Cluster : ecs-bookeroo-dev

Status: ACTIVE

Get a detailed view of the resources on your cluster.

Cluster ARN	arn:aws:ecs:ap-southeast-2:580827140556:cluster/ecs-bookeroo-dev
Registered container instances	0
Pending tasks count	0 Fargate, 0 EC2, 0 External
Running tasks count	3 Fargate, 0 EC2, 0 External

Draining service count	0 Fargate, 0 EC2, 0 External

Services Tasks ECS Instances Metrics Scheduled Tasks Tags Capacity Providers

Create Update Delete Actions ▾

Last updated on October 21, 2021 11:35:05 PM (3m ago)

Service Name		Status	Service typ...	Task Definit...	Desired tas...	Running tas...	Launch typ...	Platform ve...
<input type="checkbox"/>	bookeroo-service-login	ACTIVE	REPLICA	bookeroo-tas...	1	1	FARGATE	LATEST(1.4.0)
<input type="checkbox"/>	bookeroo-service-transaction	ACTIVE	REPLICA	bookeroo-tas...	1	1	FARGATE	LATEST(1.4.0)
<input type="checkbox"/>	bookeroo-service-book	ACTIVE	REPLICA	bookeroo-tas...	1	1	FARGATE	LATEST(1.4.0)

We then created a service for each of our task definitions, in order to automate the deployment for our tasks and support re-deployment on updates.

Services	Tasks	ECS Instances	Metrics	Scheduled Tasks	Tags	Capacity Providers
Run new Task						Last updated on October 21, 2021 11:39:35 PM (0m ago)
Desired task status: Running Stopped						
Filter in this page						Page size 50
	Task	Task definition	Container in...	Last status ...	Desired stat...	Started at
<input type="checkbox"/>	85ccf1c55cf6...	bookeroo-tas...	--	RUNNING	RUNNING	2021-10-20 2...
<input type="checkbox"/>	a078c2952be...	bookeroo-tas...	--	RUNNING	RUNNING	2021-10-20 2...
<input type="checkbox"/>	b4d7cb78ff34...	bookeroo-tas...	--	RUNNING	RUNNING	2021-10-20 2...

The service will automatically start the number of services we specify, in which we set each service to run one task each. However, after implementing this, we ran into a small problem, where the public DNS of our tasks keep changing after each re-deployment, causing issues with trying to integrate our APIs with the front-end. In the end, we have decided to fix this issue by integrating our services with a Network Load Balancer (NLB), and attaching an elastic IP address to it.

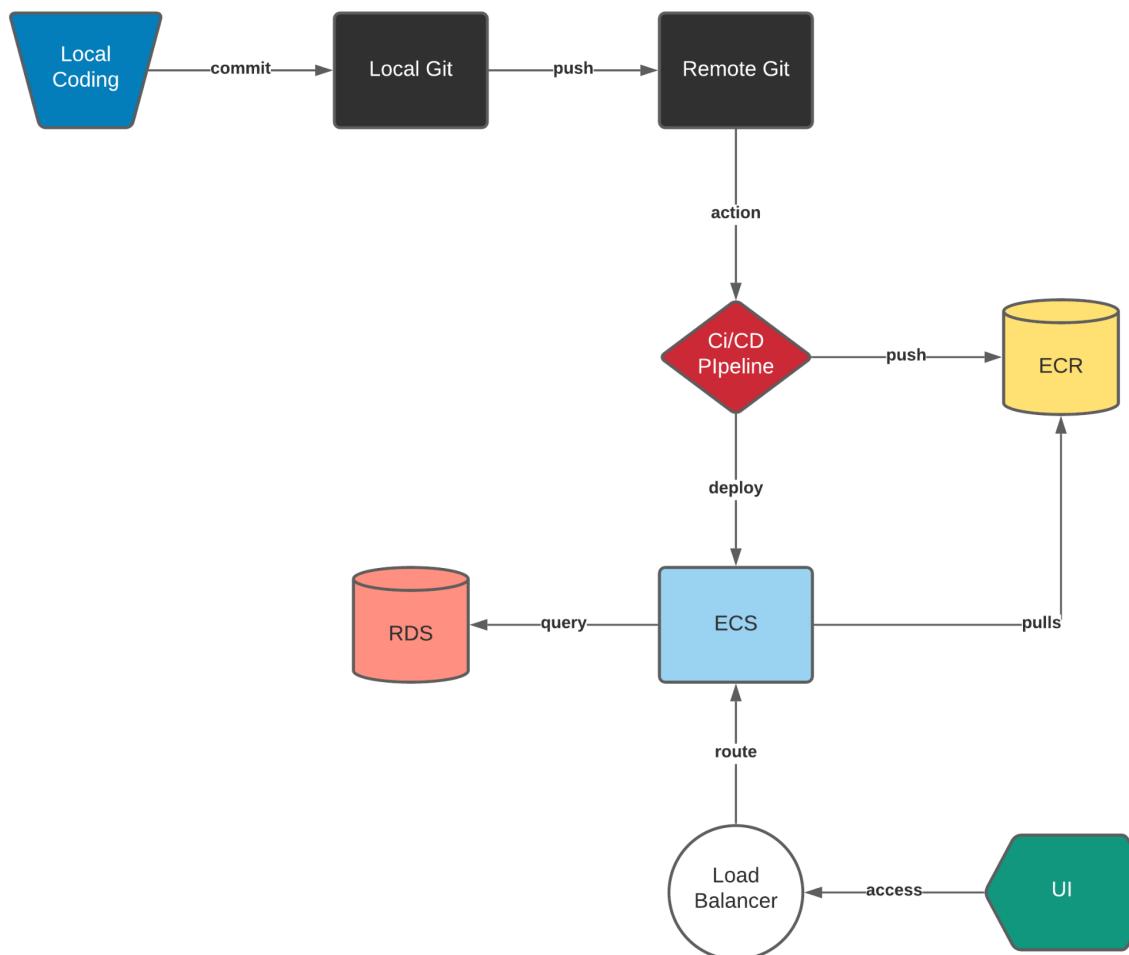

Create Load Balancer		Actions				
<input type="text"/> Filter by tags and attributes or search by keyword						
	Name	DNS name	State			
<input type="checkbox"/>	bookeroo-dev-nlb	bookeroo-dev-nlb-eed42f37...	Active			
	VPC ID	Availability Zones	Type			
	vpc-0d796d148cc057dc8	ap-southeast-2a	network			
	Octo					
Load balancer: bookeroo-dev-nlb						
<input type="button"/> Description <input type="button"/> Listeners <input type="button"/> Monitoring <input type="button"/> Integrated services <input type="button"/> Tags						
Listeners listen for connection requests using their protocol and port. You can add, remove, or update listeners and listener rules.						
To view and edit listener attributes, select the listener and choose Edit.						
<input type="button"/> Add listener <input type="button"/> Edit <input type="button"/> Delete						
	Listener ID	Security policy	SSL Certificate	ALPN policy	Default action	
<input type="checkbox"/>	TCP : 8070 arn...e9b6ebe41b1c0097	N/A	N/A	N/A	forwarding to bookeroo-transaction-target	
<input type="checkbox"/>	TCP : 8080 arn...c172205ad9142f6e	N/A	N/A	N/A	forwarding to bookeroo-login-target	
<input type="checkbox"/>	TCP : 8090 arn...4896c29e2010c6e8	N/A	N/A	N/A	forwarding to bookeroo-book-target	
EC2 > Target groups						
Target groups (3) Info						
<input type="text"/> Search or filter target groups						
	Name	ARN	Port	Protocol	Target type	Load balancer
<input type="checkbox"/>	bookeroo-book-target	arn:aws:elasticloadbalancin...	8090	TCP	IP	bookeroo-dev-nlb
<input type="checkbox"/>	bookeroo-login-target	arn:aws:elasticloadbalancin...	8080	TCP	IP	bookeroo-dev-nlb
<input type="checkbox"/>	bookeroo-transaction-target	arn:aws:elasticloadbalancin...	8070	TCP	IP	bookeroo-dev-nlb

The load balancer requires the creation of target groups, and for them to be attached as listeners for the load balancer to properly forward requests on specific ports.

Elastic IP addresses (1/1)					
<input type="button" value="C"/> Actions ▾ <input type="button" value="Allocate Elastic IP address"/>					
<input type="text"/> Filter Elastic IP addresses					
Name	Allocated IPv4 add...	Type	Allocation ID	Associated instance ID	
–	13.237.200.50	Public IP	eipalloc-00fb5b3eba570548	–	

The use of elastic IP on the load balancer allows the re-deployed tasks to be accessed from the same public IP each time, which was essential for our deployment. With this, we have successfully deployed our services into AWS and tested everything to be fully working.

DEPLOYMENT DIAGRAM (BACKEND)

DOCKER (FRONTEND)

For docker frontend I used nginx as a proxy server to build the image, this enable faster frontend bundling.

```
1  FROM node:14-alpine AS builder
2  RUN mkdir /app
3  ENV NODE_ENV production
4  # Add a work directory
5  WORKDIR /app
6  # Cache and Install dependencies
7  COPY package*.json ./
8  RUN npm install
9  # Copy app files
10 COPY . .
11 # Build the app
12 RUN npm run build
13
14 # Bundle static assets with nginx
15 FROM nginx:1.21.0-alpine as production
16 # Copy built assets from builder
17 COPY --from=builder /app/build /usr/share/nginx/html
18 # Add your nginx.conf
19 COPY nginx.conf /etc/nginx/conf.d/default.conf
20 # Expose port
21 EXPOSE 80
22 # Start nginx
23 CMD ["nginx", "-g", "daemon off;"]
```

CI AND DEPLOYMENT (FRONTEND)

1. Service setup

The frontend CI/CD uses Docker for deployment, the CI will be triggered in every pull request into Develop and CD will be triggered in every merge into Develop. Here's the step of the pipeline:

1.1 Push to ECR

The latest image will be pushed to AWS ECR, AWS ECR is a service that hosts docker image provided from AWS.

The screenshot shows the Amazon ECR console with the 'Private' tab selected. A single repository named 'sept-fe' is listed. The repository details are as follows:

Repository name	URI	Created at	Tag immutability	Scan on push	Encryption type
sept-fe	500737272218.dkr.ecr.ap-southeast-2.amazonaws.com/sept-fe	30 September 2021, 20:41:30 (UTC+10)	Disabled	Disabled	AES-256

1.2 Elastic Container Service deploys the image

The ECS will pick up the latest image from ECR repo and deploy it with AWS fargate.

The screenshot shows the AWS CloudWatch Metrics dashboard for the 'sept-bookeroo-prod' cluster. The metrics are categorized into three sections: FARGATE, EC2, and EXTERNAL.

- FARGATE:** Shows 1 Service, 1 Running tasks, and 0 Pending tasks.
- EC2:** Shows 0 Services, 0 Running tasks, 0 Pending tasks, and 0 EC2 container instances. There are two greyed-out CPUUtilization and MemoryUtilization metrics.
- EXTERNAL:** Shows 0 Services, 0 Running tasks, 0 Pending tasks, and 0 ECS container instances.

Cluster : sept-bookeroo-prod

1.3 Load balancer provides public-facing access

The frontend service is protected behind a Load Balancer with public access on port 80.

```

DEPLOYMENT DIAGRAM (FRONTEND)

SOFTWARE ENHANCEMENT

Although we are satisfied with the software that we have produced over the 4-sprint period we have identified some aspects of the software that could have been improved:

- Provide more visual feedback for users particularly with the forms - we only use the generic input error message for any form error.
- Have more documentation regarding CI/CD, backend, frontend - we could have added a central knowledge repository for all team members to provide information on how CI/CD was set up, the API endpoints and repository structure of the frontend.
- Refactoring to a Design Pattern - we could have spent more time on refactoring to design patterns such as using MicroFrontend for Frontend.
- Creating two versions of Software - We plan to create two software versions one for Development the other for Production.
- Follow Deployment practice - We plan to follow AWS deployment practice and set up the CD to be more rigorous by applying Blue-Green Deployment practice.
